HAEMATOLOGY BLEEDING TIME & CLOTTING TIME

TEST DESCRIPTION	RESULT	REF. RANGE	UNIT
Bleeding Time	6	2 - 7	minutes
Clotting Time	8	4 - 11	minutes

Interpretation:

- The Bleeding Time Clotting Time (BTCT) test measures the time it takes for a small puncture wound to stop bleeding and the time it takes for a clot to form in a blood sample. This test is used to evaluate the function of platelets and coagulation factors in the blood, and to diagnose bleeding disorders.
- If your BTCT test results are outside the normal range, it may indicate a bleeding disorder, such as von Willebrand disease or a deficiency of clotting factors.
- A prolonged bleeding time may indicate that your platelets are not functioning properly, which can lead to increased bleeding and bruising. A prolonged clotting time may indicate a deficiency of coagulation factors, which can lead to excessive bleeding and difficulty in forming clots.
